

USSR:

Angular distribution of photons of the destruction of
electron-positron pairs. V.G. Balkay and N.P. Klyapko.

Vestn. Moskov. Univ. B, No. 6, Ser. Fiz.-Mat. i Estestven.
Nauk No. 4, 103-110 (1953).—Annihilation of positrons in
metals is considered on a theoretical basis. The features
are (1) the assumption of a Maxwell distribution of the
velocities of the positrons and (2) the introduction of Cim-
bolic factors in the probability of the annihilation pro-
cesses. The distribution can then be calcd. by the equation:

$N(x) = \int_0^\pi d\psi \Phi(\psi, x) N(\psi)$ where x is the angle between the
lines joining the photon source and the counters for their
detection, ψ is the angle between the emitted photons, and
 $\Phi(\psi, x)$ is a geometrical function of ψ and x . $N(\psi)$ is a
function which is related to the probability of annihilation
as based on Dirac's theory. The results from the theoreti-
cal calcns. are compared with the exptl. data obtained by
Vlasov and Dzhelkov (C.A. 43, 7439a, 0388c). Extension
to the cases of 3 photon emission annihilation processes
is discussed.

BAKLITSKIY, V.K.

86-8-20/22

AUTHOR: Baklitskiy, V.K., Eng.Lt.

TITLE: An Unacceptable Recommendation (Rekomendatsiya, s kotoroy
nel'zya soglasit'sya)

PERIODICAL: Vestnik Vozdushnogo Flota, 1957, Nr 8, p.89 (USSR)

ABSTRACT: In the periodical "The Herald of the Air Fleet", 1957,
Nr 3, pp.59-65, Eng.Maj. I.A. Globus published the
article "Ably Exploit the Radar Systems" (Umelo
Ekspluatirovat' Radiotekhnicheskiye Sistemy), in which the
author suggests a method for checking the efficiency of
the receiver by tuning the local oscillator [in Russian
text - "geterodin"] of the unit KLB to the frequency of
the second channel. Maj. Globus maintains that if the
selector switch is set in the position "Reception", and
if during the process of tuning the channel a pulse appears
on the screen, the receiver should be replaced.
Eng.Lt. Baklitskiy cannot agree to the said recommendation
for the following reason. In that case, a signal produced
either by mirror effect or by combination frequency may
appear on the screen. Such a phenomenon frequently occurs
while measuring the frequency characteristic of a receiver.

Card 1/5

86-8-20/22

An Unacceptable Recommendation (Cont.)

The relatively high output of the local oscillator, its tight coupling to the receiver with a high amplification, does not exclude the appearance of an intelligible "parasitic pulse" on the screen. In addition, on constant tuning of the local oscillator, a flattened (erased) but sufficiently clear signal may be observed in the background of set noise (produced within the receiver) at various points of the receiver frequency band. This was explained by the additional condition favoring the appearance of combined frequency signals which are created by the radio frequency spectrum of a square pulse. Accuracy in the operation of the discussed radar system depends much more on the duration of a retransmitted pulse by the ground station. To obtain a wide band-pass, a multistage intermediate frequency (I.F.) amplifier with coupled detuned circuits is required in the receiver. It permits the achievement of high amplification and increases the band-pass to twice its width. Such an amplifier, however, is not free from some disadvantages, because the band-pass and the amplification largely depend upon the characteristic of the tube. A tube with higher mutual conductance possesses too large a spread of input and output capacitances

Card 2/5

86-8-20/22

An Unacceptable Recommendation (Cont.)

(in Russian - "imeet slishkom bol'shoy razbrov vkhodnoy i vkhodnoy yemkosty") that may weaken (reduce) the signal level. This is the reason why, after the replacement of the tubes, the I.F. circuits should be retuned immediately. In the author's unit a special stand has been provided for that purpose and equipped with a meter-wave oscillator, oscilloscope and rectifier. The sequence of operations during the process of retuning is as follows: The left-hand side shield should be removed and the local oscillator tube pulled out. A wire 10 - 15 cm long should be soldered to the socket of the L5-9 tube (pin 7). After passing through a hole in the shield, the opposite end of the wire, is connected to the output of the vertical deflection amplifier. The output of the meter wave oscillator (GMV) is connected through a feeder to the antenna input of the receiver. The latter is supplied by the rectifier. In such a way the oscillations modulated by a square pulse of the amplitude 3 - 5 mv and the frequency equal to the midband intermediate frequency have been supplied from the oscillator (GMV) to the receiver. The signal appearing on the screen should be observed and its amplitude decreased until the

Card 3/5

86-8-20/22

An Unacceptable Recommendation (Cont.)

set noise became audible. Then, with the help of alignment screws of the 7, 2 and 1 circuits in the UPCh [in Russian expanded text - "usilitel' promezhutochnoy chastoty - intermediate frequency amplifier"], maximum value of the output signal should be obtained. By changing the frequency of the oscillator (GMV) within the limits of the upper and lower values of I.F., the circuits 4 - 6 and 3 - 5 of the amplifier (UPCh) should be tuned in the same way. The retuning process should be repeated several times with continually decreased input signal until it is still noticeable in the background of the noise. The band pass of the receiver should be measured (gaged) at the level 0.5. As was shown by several experiments, the sensitivity of a receiver may exceed its optimal value after the tuning of the I.F. amplifier circuits. In those cases, there is a possibility of triggering the transmitter by the noise produced within the receiver. However, this may easily be avoided by taking the following steps. From the output of the meter-wave oscillator, the voltage corresponding to the upper I.F. value is used for that purpose, and the alignment screw of the 4th circuit must be turned in to the end,

Card 4/5

An Unacceptable Recommendation (Cont.)

86-8-20/22

thus keeping constant the maximum output voltage of the receiver. Then, applying the voltage corresponding to the lower value of the I.F., the position of the core in the 3rd circuit should be adjusted by the maximum of the receiver output voltage. While carrying out these adjustments during the exploitation of the discussed radar system, the band pass of the receiver should be widened slightly and its sensitivity blunted (dulled). The top part of the frequency response curve is used here, without the change of optimal values which were gained during the tuning of the UPCh circuits. The band pass width has frequently been determined by the difference in the grid screen divisions. To do this, the receiver should first be detuned in both directions to reduce the signal by half of its maximum value. In this case, however, the received figures may be exaggerated two, three and sometimes even four times because of the dependence of the construction (design) peculiarities of the receiver and its tuning. By measuring the receiver band pass on a stand, that error may also be avoided.

BAKLITSKIY, Y.

AUTHOR: Baklitskiy, Y. 107-58-6-41/58

TITLE: Transistorized Impulse-Noise Limiter (Ogranichitel' impul'snykh pomekh na poluprovodnikovykh triodakh)

PERIODICAL: Radio, 1958, Nr 6, pp 46-47 (USSR)

ABSTRACT: In "Radio", 1956, Nr 11, A. Gorbachev described in his article "Receiver Attachment for Reducing Impulse Noise" the function of an impulse noise limiter built with a "6N1P" double triode for radio receivers as suggested by D.V. Ageyev. Frequency conversion of the signal (by amplitude) and a limiting threshold, tracking the loudness level, were used. Since the impulse noise limitation is made at low frequencies, such an attachment may be built with transistors. The device described by the author will fit into any commercial or amateur receiver and has small dimensions and low current consumption. Transistors "PlA", "PlB" and diodes "D2D" or "D2B", "DG-Ts8" are used. Figure 1 shows the circuit diagram of the impulse noise limiter. Figure 3 shows a modification of the impulse noise limiter. This device was developed by order of the periodical "Radio". There are 2 diagrams, 1 graph and 1 Soviet reference.

Apparatus metallurgists tom 3 "Metallurgists' Handbook", v. 3
Moscow, Metallurg, 1960, 1,164 p., 150,000 copies printed.

Editorial Council: N. S. Amerikian (Chairman and Chief
Ed.), Doctor of Technical Sciences; G. N. Malov, Z. N. Podzhalova,
Ph.D., Doctor of Technical Sciences; G. N. Malov, Z. N. Podzhalova,
A. N. Poteryach, G. S. Stol'n, and N. A. Chernavskiy,
A. N. Malov, Ed. of Publishing House; N. I. Ollidov,
N. N. Pech, Ed.; T. V. Koval'ev, Publishing Ed.; V. V. Romanov,
V. V. Romanov (Responsible); V. V. Romanov, Editor.

PURPOSE. This handbook is intended for process engineers,
designers, foremen, and other workers in the metalworking
industry.

CONTENTS. The handbook deals with such metalworking processes
as turning, reaming, boring, drilling, gear cutting, burnishing, grind-
ing, and planishing. Data are presented primarily in tabular
form and are illustrated by drawings and diagrams.
Some illustrations are provided. There are no references.

II. Handbook of Tools (Yu. P. Rastorguyev, L. A. Rondot-
skaya, and Yu. D. Bakhmurov).

III. Milling (Yu. V. Artyukh).

IV. Basic Information
Basic elements of milling cutters
Milling cutters
Construction of basic types of milling cutters
Accuracy and characteristics of machine
Accuracy and smoothness of machine
Milling machines
Accumulation of milling operations
Milling heads

V. Gear-cutting (Yu. I. Prusikin, T. A. Solomennikov, and A. N.
Bakulin) and internal thread cutting with single-point
tools (Yu. I. Prusikin)

VI. Spur-gear Cutting (S. P. Kartsev, A. N. Malov, V. M.
Matyushin, V. V. Romanov, and Q. M. Sushchenko)
General information (A. N. Malov)
Gear-cutting methods
Setup of gear-cutting machines
Setup of gear shapers
Gear-cutting tools for spur gears (V. M. Matyushin)
Illustrations of gear-generating tools
Tools for cutting spur gears by duplicating and
hobbing methods
Determining the profile of tools for duplicating
Tools for cutting spur gears by the hobbing method
Gears (S. P. Kartsev and V. V. Romanov)
Gear-shaper cutters (V. M. Matyushin)

PHASE I BOOK EXPLOITATION

SOV/4995

Baklunov, Yevgeniy Dmitriyevich

Protyazhki; konstruktsiya, tekhnologiya izgotovleniya i ekspluatatsiya (Broaches; Design, Manufacture, and Operation) Moscow, Mashgiz, 1960. 167 p. 5,000 copies printed.

Reviewer: L. K. Manuylov, Candidate of Technical Sciences; Ed.: F. N. Zevakin, Engineer; Ed. of Publishing House: A. F. Balandin; Tech. Ed.: V. D. El'kind; Managing Ed. for Literature on Metalworking and Machine-Tool Making: V. V. Rzhavinskiy, Engineer.

PURPOSE: This book is intended for toolmakers and production personnel dealing with the use of broaches.

COVERAGE: The book reviews the basic aspects of broaching, and contains information on the design of broaches, the construction of their basic types, and the processes involved in their manufacture. Special features in the use of broaches are also considered. The author distinguishes two methods of broaching (free broaching and reference-frame broaching) and three basic

Card 1/4

Broaches; Design, (Cont.)

SOV/4995

patterns of cutting (direct profile cutting, generating or progressive cutting, and alternate or staggered-tooth cutting). No personalities are mentioned. There are 7 references, all Soviet.

TITLE: Experimental and analytical determination of forces in
cold rolling

PUBLICATION: Izvestiya vysshikh uchebnykh zavedeniy, Chernaya
metallurgiya, 1961, No.6, pp.191-193

TEXT: In the course of an earlier investigation carried out by
the present authors (Ref.1: Izvestiya vysshikh uchebnykh zavedeniy,
Chernaya metallurgiya, 1959, 8), large discrepancies were found
between the laboratory results and the operational data on forces
acting on the rolls during cold rolling. It was revealed,
however, in the course of further tests that in many cases the roll
chucks had become worn (in some places to a depth of 0.4 mm) and
it was postulated that this factor may have affected the load cell
readings. In an attempt to find a way of eliminating this source
of error, both during the calibration of the load cells and later
in use, the effect of lead washers approximately 2 mm thick,
placed under the dynamometers, was investigated. Fig.1 shows the
Lead-146

Experimental and analytical ...

S/148/61/000/006/013/013
E193/E480

experimental conditions: 1 - an annular washer supporting the load cell along its periphery; 2 - a solid washer under the central part of the load cell; 3 - no washer; 4 - a solid washer of the size equal to that of the load cell. On the right-hand side of Fig.1, the calibrating force is plotted against the load cell readings; most consistent results were obtained when a large solid washer was used (graph 2). The latter method was employed in roll force measurements and the results compared with roll force values, calculated according to A.I.Tselikov and A.A.Korolev (Ref.2: Prokatnyye stany, Metallurgizdat, 1958). The results are tabulated. It will be seen that the difference reached occasionally 30 or even 37%, the experimental values being always lower than the calculated figures. One possible explanation of this effect is provided by the fact that the temperature of cold rolled metal increases. Although the strength of the carbon steels and constructional alloy steels increases on heating between 20 and 400°C, this increase takes place during cold rolling at certain rolling speeds only. According to M.I.Manjoine (Ref.5: Journal of the Iron and Steel, v.150, p.3, VI, 1947, 380), Card 276

Experimental and analytical ...

5/148/61/000/006/013/013
E193/E480

the "ageing peak" is shifted towards higher temperatures when the steel is rolled at high rolling speeds, so that under these conditions the strength of steel between 0 and 400°C decreases with increasing temperature. Consequently, if the temperature attained by the metal during cold rolling at high speeds is 300°C, its resistance to deformation (particularly at heavy drafts) decreases, which explains the discrepancy observed. There are 2 figures, 1 table and 5 references: 4 Soviet and 1 non-Soviet. The reference to an English language publication reads as follows: M.I.Manjoine, Journal of the Iron and Steel, v.150, p.3, VI, 1947, 380.

AUTHORS: Baklushin, L.N.; Gaydukovskiy, N.V.; Dukhin, I.S.; - Engineers

TITLE: Electric-pulse machining of transverse flutes on grooves of rolls
for rolling alternating reinforcement sections

PERIODICAL: Stal', no. 4, 1962, 330 - 333

TEXT: The Eksperimental'nyy nauchno-issledovatel'skiy institut metallorenzhushchikh stankov (Experimental Scientific Research Institute of Metal-Cutting Machine Tools, ENIMS) and the Magnitogorskiy metallurgicheskiy kombinat (Magnitogorsk Metallurgical Combine) have developed a pilot installation for fluting rolls of elevated hardness by means of unipolar electric pulses of medium and long duration (10^{-4} - 10^{-2} sec). The pilot equipment was designed in cooperation with A.S. Opolinskiy (ENIMS), N.V. Gaydukovskiy, A.P. Shemyavich, I.L. Prisazhnyuk, G.M. Gubanishev and V.A. Bezobrazov (MMK). By this method the metal is removed directly from the rolls by the force of loaded particles. Consequently, the operating elements of the machine need only be of simple design and their number can be increased considerably (up to more than 20 grooves). The tool need not be of exceptionally hard or strong material; it may also have various shapes.

Card 1/3

Electric-pulse machining of transverse

S/133/62/000/004/006/008
A054/A127

the main object being that the shape is suitable for fluting at a high rate a great number of grooves. An MFI-2 (MGI-2) type machine generator was used for the generation of the electric pulses (pulse frequency: 400/sec; average power 4.3 - 6.4 kw; current 80 - 100 amp; metal cutting rate (for steel) 1,200 - 1,500 mm³/min; drive motor speed 3,000 rpm; its power: 6 kw). The pilot equipment was reconstructed from an old horizontal milling machine. The electrode is a copper tube, coiled with trapezoidal copper wire; the pitch and number of threads correspond to the projections on the rolled rod. There are 3 patterns for the interaction between the electrode and the roll (Fig. 1). Version II was used on the pilot installation, ensuring a large contact surface between the roll to be fluted and the electrode. In this version the electrode moves together with the feed table and the roll rotates in the same direction. Version III of the roll-electrode interaction, however, promises an even larger contact surface, in spite of the process being intermittent, due to the reciprocating motion of the electrode in this case. The feed is controlled automatically. The machine must be adjusted in such a way that there is no play of the roll in the direction of the feed mechanism, that the electrode is fixed accurately in respect of the groove axis and that the peripheral speed of the roll is synchronized with the linear speed of the electrode. The number of flutes to be eroded (the number of

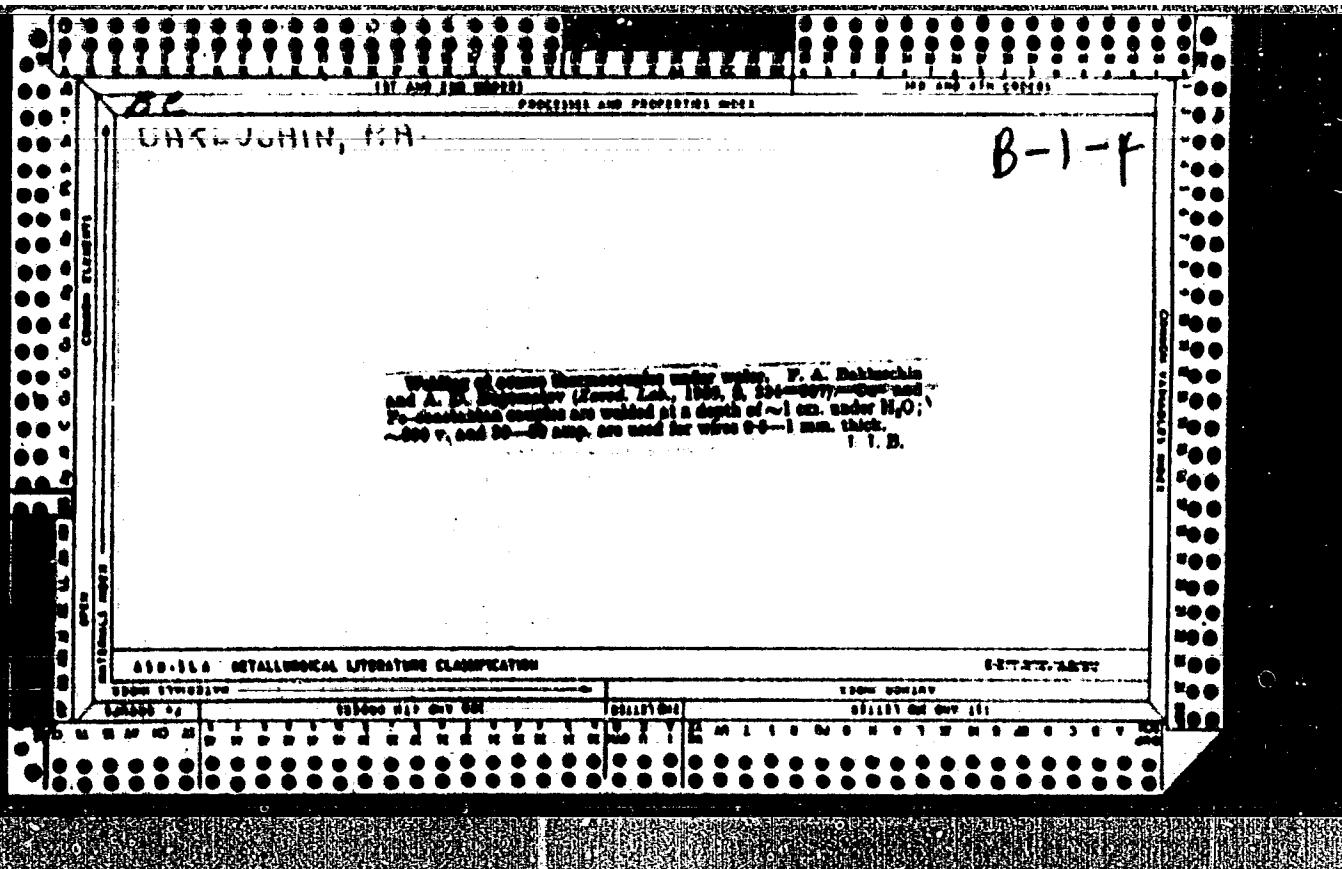

Card 2/4

Electric-pulse machining of transverse

S/133/62/000/004/006/008
A054/A127

threads on the electrode) can be calculated with $z = \frac{\pi D}{l}$ (D = roll diameter at the groove bottom, l = pitch of fluting). The total depth of the flute is obtained during one revolution of the roll. The method is applied in rolling No. 10 and 12 sections on the 250-I small section rolling mill (barrel-diameter 300 mm; barrel length 750 mm; roll-neck diameter 160 mm; roll-neck length 260 mm). After having tested rolls of various grades (alloyed cast iron, cast iron with an elevated nickel content, etc) and of varying hardness (400 - 420 H_B or 54 - 56 H_{Sh}, 55 - 65 H_{Sh}) it was found that for rolling No. 10 and 12 sections, rolls made of chilled carbon cast iron with a barrel minimum hardness of 70H_{Sh} is the most suitable for this purpose. It is important that the working surface of the electric-pulse machined rolls does not form any stable joint with the metal rolled and scale, which would spoil the groove. The inclination of the flute walls is increased when the electric pulse method is used which improves the bond between concrete and reinforcement. The new fluting method saves 3.5% of metal on an average during rolling and reduces the weight of 1 running meter of sections from 944 to 912 g (with new grooves) and from 991 to 959 g (with worn grooves). The service life of electric-pulse machined rolls is increased by a factor of 2. There are 3 figures and 2 tables.

Baklushin, Petr Aleksandrovich, Igor' Konstantinovich Kiselev, and Lidiya Ivanovna Kubasova

Avtomatizatsiya teploenergeticheskikh ustanovok (Automation of Heat Power Installations) Moscow, Gosenergoizdat, 1960. 351 p. Errata slip inserted. 15,000 copies printed.

Ed.: P.N. Mamuylov; Tech. Ed.: G. Ye. Larionov.

PURPOSE: This book is intended for students of heat power problems in polytechnic and power engineering schools of higher education. It may also be useful to heat power engineers dealing with automation of heat processes at electric power stations.

COV : The book discusses the automation of heat power installations and the physical nature of automatic control. Fundamentals of automatic control and certain procedures of its engineering utilization are presented. Schematic circuits of the automation of basic assemblies and auxiliary equipment of heat power installations are discussed. Elements and structural features of the most widely used types of automatic regulators are described and analyzed.

Automation of Heat Power Installations

SOV/5536

Problems of disposing automation components on the instrument boards of steam electric power stations are also discussed. The Foreword, Chs. I, VIII, IX, XIII, XVI, XVIII, XX, and conclusion were written by P.A. Baklushin, who also carried out the general planning and editing of the book; Chs. V, VI, and VII by I.K. Kiselev; Chs. II, III, IV, X, XI, XII, XIV, XVII and XIX, by L.I. Kubasova. The authors thank S.G. Gerasimov, Professor, P.N. Manuylov, Engineer, and M.A. Tartushkina, Engineer, for their help. References to each part are listed separately in the Bibliography. There are 42 references, all Soviet.

TABLE OF CONTENTS:

Foreword	3
Introduction. Concept of Automation of Heat Power Installations	
1. Elementary concepts and historical references	9
2. Types of automation for heat power installations	11
3. Economic importance of heat power installations	17
4. Remarks on mathematical foundations of the theory of automatic control in heat power installations	17

3613. THE DETERMINATION OF THE VOLUME OF BLOOD ELEMENTS BY
A HAEMATOCRIT (Russian text) - Bakman S. M. - LAB. DELO 1957,
2 (15-18)

The haematocrit number, i.e. the ratio of the volume of the blood elements in question to the volume of whole blood, is of prime importance when the problem of the transfusion of a large amount of fluid and of the choice of blood components to be transfused has to be solved. A simplified method of determination of the haematocrit number, suggested by Sokolov, was checked by the author in 807 cases. Sokolov's data of final sedimentation of red cells in Panchenkov's apparatus in 24 hr. were not confirmed. The possibility of applying the suggested method is doubtful.
